

## FMS Tip #4

### **Runaway Queries**

When you are running queries:

1. Never use the cancel or stop button in your browser's toolbar. This will not stop the query from running. You must let it run to completion or failure.
2. Do not open another browser window and restart the same query – this just takes up CPU time and your query will not run any faster.

### **Query Results Tab**

When you are looking at your query results on the Results tab do not click onto another tab until you are finished with the Results tab. Clicking on another tab causes you to lose the information on the Results tab. You will need to rerun your Query to see the results again.
